Dodona — cluster sanity

one pass, no load 2026-10-10 16:08 UTC

1. Endpoints

PASS gateway /metrics

PASS gateway /v1/models

PASS prefill /metrics

PASS decode /metrics

2. Model and pools

PASS gateway advertises: Qwen/Qwen2.5-7B-Instruct-AWQ

pool	running	waiting	prompt tok	gen tok
prefill	0	0	13,988	11
decode	0	0	13,988	455

prompt tok 0 on a pool means nothing was ever routed to it.

PASS prefill generated 11 tokens (expected near 0, max_tokens=1)

3. Capacity

quantity	value	where it comes from
KV per decode pod	4.30 GiB	pod log: Available KV cache memory
full-length seqs / pod	4.9	pod log: Maximum concurrency
decode replicas	1	kubectl get deploy vllm-decode
decode pool concurrency	4.9	seqs/pod x replicas

A pool this small is the point: a policy needs something to be scarce.

PASS pool of 4.9 is small enough for KV to bind

4. Does a request traverse the gateway

PASS orch_requests_total moved 11 -> 12

PASS completion returned in 0.319s

field	value
content	'ok'
via	local
latency	0.319s (tunnel included)

via=local means our cluster served it; via=overflow means it was bursted out.

5. The KV hop

PASS the router recorded a hop

field	value
src	prefill-0
dst	decode-0
req_id	http
tokens	16
backend	mooncake
prefix	802848469d1623df

FAIL connector transport is known: unknown

5b. Does decode re-prefill?

pool	prompt tok	prefix hits	queries	hit rate
prefill	14,024	6,688	14,024	47.7%
decode	14,024	6,688	14,024	47.7%

Decode loading blocks rather than recomputing shows as a high hit rate.

FAIL decode processes fewer prompt tokens than prefill

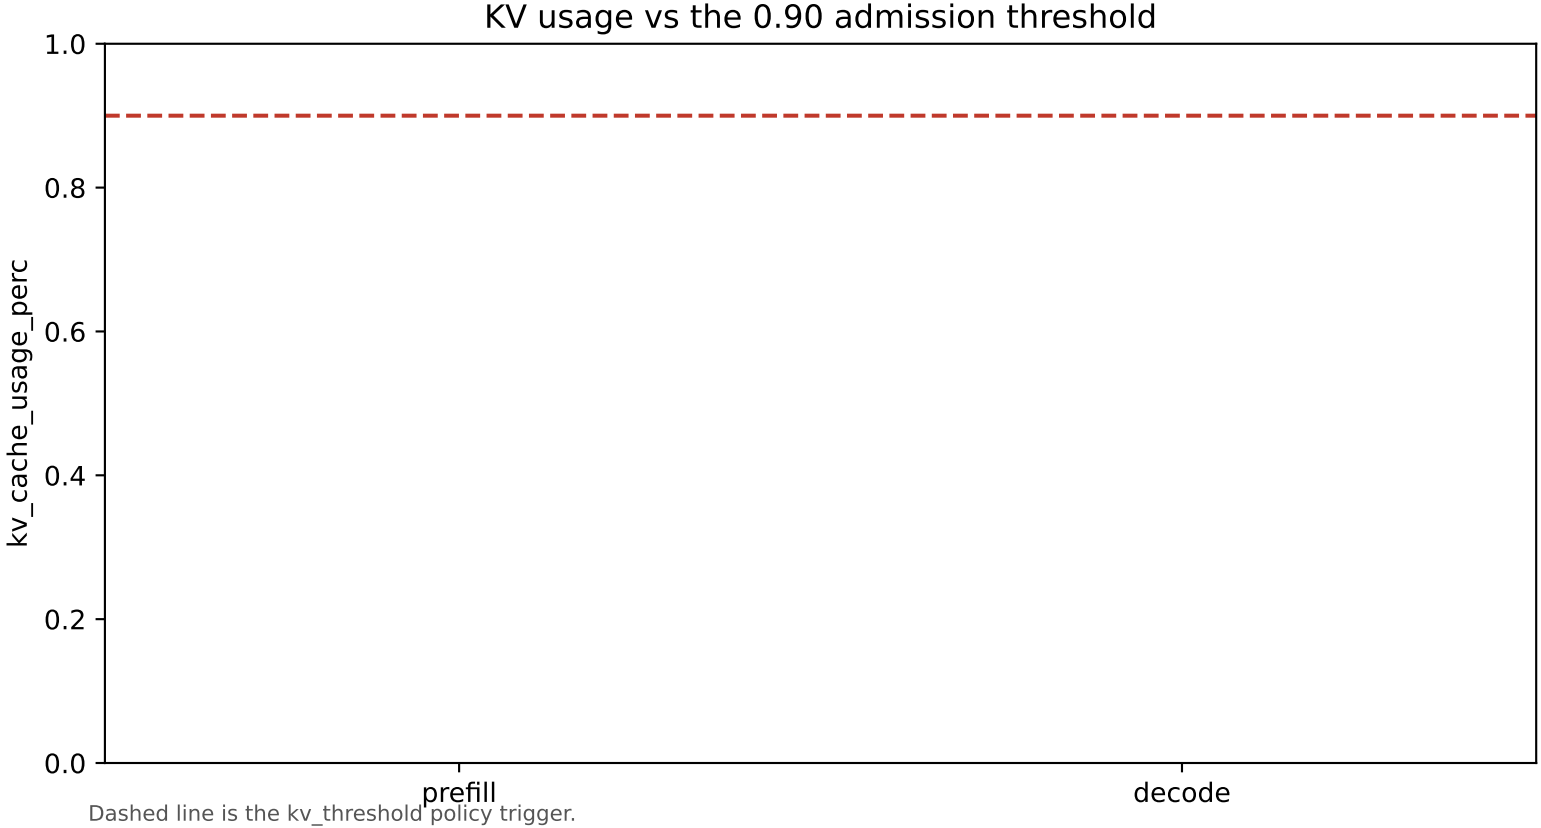

Both pools report ~14,024 prompt tokens. queue.py sends the same prompt to both legs, so this is expected — and it means decode is NOT skipping prompt work. Confirm with TTFT on a long prompt.

6. Was anything scarce

pool	kv_cache_usage_perc	vs 0.90 threshold
prefill	0.0000	BELOW
decode	0.0000	BELOW

Idle cluster: near zero is expected. make load is what moves this.

This is an idle reading, so it is not a verdict on the policy.
Scarcity is a load-test question: see make load.

KV usage vs the 0.90 admission threshold
kv_cache_usage_perc
1.0
0.8
0.6
0.4
0.2
0.0
prefill
decode
Dashed line is the kv_threshold policy trigger.
