Dodona 01 — health

is it there and wired? 2026-10-11 00:33 UTC

Objective

Is every component deployed, healthy, in the request path, and being scraped?

Falsified by: a missing deployment, an unready pod, a request that does not reach the gateway, or a metric family with no

1. Topology

deployment	ready	restarts	what it does
vllm-prefill	1/1	0	builds the prompt's KV
vllm-decode	1/1	0	generates the answer
orch-serve	1/1	0	the gateway: guardrails, admission, placement, hop
open-webui	1/1	0	hand testing, through the gateway

restarts above 0 means it has crashed at least once.

PASS all 4 deployments reached their replica count

PASS no deployment has restarted

>> Every component is deployed and none has crashed.

2. Health

PASS gateway /metrics

PASS gateway /v1/models

PASS prefill /metrics

PASS decode /metrics

PASS prometheus

>> Every endpoint answers.

3. Wiring

PASS orch_requests_total 2 -> 3

PASS a request completed in 0.332s

answered	'ok'
via	local
kv_hop recorded	True

>> A request went guardrails to admission to placement to the engines and came back 'ok'.
via=local means our cluster served it.

4. Observability

prefix	series	emitted by
vllm:	102	the engines
orch_	25	our gateway

```
  keda_        29  the autoscaler
```

0 means nothing scrapes it, not that the value is zero.

```
PASS  all 5 metric families are scraped
```

>> Every family is present, so an empty panel from here on means a real zero.
