Dodona — cluster sanity

one pass, no load 2026-10-10 15:55 UTC

1. Endpoints

PASS gateway /metrics

PASS gateway /v1/models

PASS prefill /metrics

PASS decode /metrics

2. Model and pools

PASS gateway advertises a model: Qwen/Qwen2.5-7B-Instruct-AWQ

pool	running	waiting	prompt tok	gen tok
prefill	0	0	13916	9
decode	0	0	13916	451

prompt_tokens_total of 0 on a pool means nothing was ever routed to it

3. Capacity

	value
KV per decode pod	4.30 GiB
full-length seqs per pod	4.9
decode replicas	1
decode pool concurrency	4.9

A pool this small is the point: a policy needs something to be scarce.

4. Does a request traverse the gateway

PASS orch_requests_total 9 -> 10

PASS completion returned in 0.32s

5. The KV hop

PASS router recorded a hop: {'src': 'prefill-0', 'dst': 'decode-0', 'req_id': 'http', 'tokens': 16, '

FAIL connector transport: unknown

pool	prompt tok	prefix hits	queries	hit rate
prefill	13952	6624	13952	47.5%
decode	13952	6624	13952	47.5%

Decode loading blocks instead of recomputing shows up as a high hit rate here.

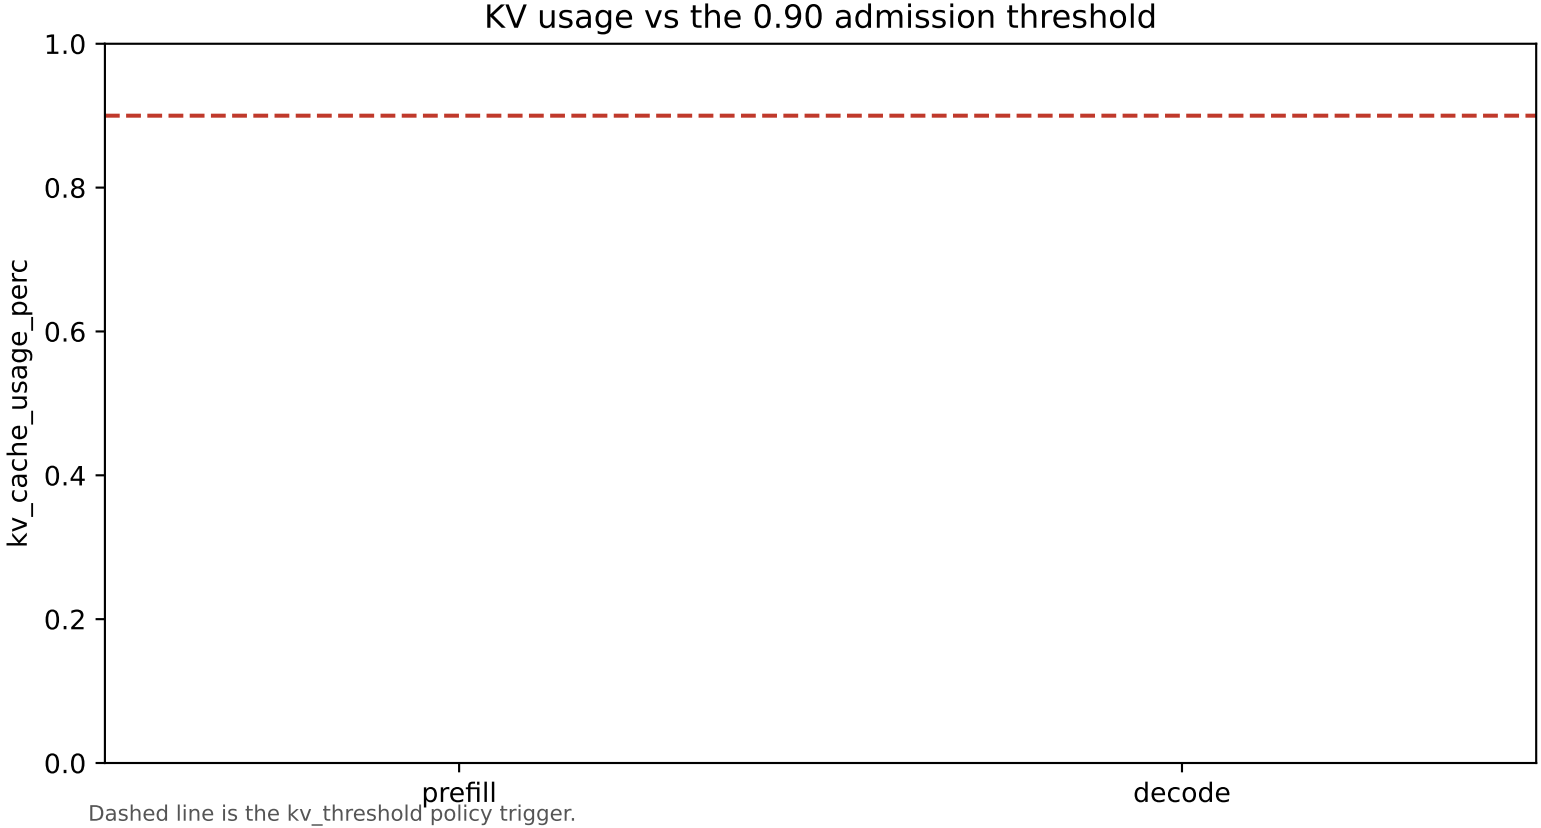

Both pools report ~13,952 prompt tokens. Consistent with decode
recomputing the prompt rather than loading it. Confirm with TTFT.

6. Was anything scarce

pool	kv_cache_usage_perc
prefill	0.0000
decode	0.0000

Idle cluster: near zero is expected here. make load is what moves it.

This is an idle reading. Scarcity is a load-test question:

KV usage vs the 0.90 admission threshold
kv_cache_usage_perc
1.0
0.8
0.6
0.4
0.2
0.0
prefill
decode
Dashed line is the kv_threshold policy trigger.
